Feature Request Matcher

Kaleb Jensen | Enterprise Customer Success Manager, Connecteam | $2.15M enterprise portfolio across 30 clients

SITUATION & TASK

Across my 30 enterprise clients, people ask for features constantly during day-to-day calls. Those asks are easy to lose, and when a feature finally ships, it is hard to remember which client asked for it. Meanwhile, multiple release note emails arrive every day. Without a system, the moment to go back and say "you asked, we delivered" slips by. My task: make sure no request gets lost and every client hears back when their feature ships.

ACTION: THE SOLUTION

I built an automation, with ChatGPT's help, that captures feature requests straight from my client calls, logs and tallies them by client in a Google Sheet, and each morning checks the latest release notes against every request on record. It tells me which clients asked for a feature that just shipped and drafts a short email so I can let them know.

ACTION: HOW IT WORKS

1. **Capture from calls.** The Attention AI API pulls my day-to-day client calls and extracts the feature requests mentioned in them.
2. **Log in one place.** Each request goes into a Google Sheet organized by client, who asked for it, and what the feature is.
3. **Match and tally.** New requests are checked against existing ones and matched up, keeping a running tally of how often each type of feature is requested.
4. **Morning release check.** Gmail is connected to ChatGPT through a scheduled action. Every morning it reviews the release note emails from the last 24 hours against all-time feature requests.
5. **Recommend and draft.** It recommends which clients asked for features that are now released and drafts a basic email explaining the release, so I know who to contact and can send a quick "the feature you asked for is live" note.

STACK

- **Attention AI API** · call capture + extraction
- **ChatGPT** · built the system + analysis
- **Google Sheets** · request log + tally
- **Gmail + ChatGPT scheduled action** · daily release check + drafts

RESULT

- By the next morning after a release, I know exactly which clients to tell.
- Closes the loop with clients who took the time to ask for something.
- Scales proactive, personal outreach across a large enterprise book.
- Draft outreach is ready to review and send, not written from scratch.
- The request tally shows which asks come up most across accounts.

Next: harden the request matching and reduce the manual steps before sending.

THE ONE-LINE PITCH

I turned everyday client calls and daily release notes into an automated loop that tells me each morning which clients asked for what just shipped, with an email ready to send.
